

Since April 2026, solo GTM engineering and RevOps function at Securitaly, an Italian B2B group running seven e-commerce and SaaS brands. Designed and built the data infrastructure, AI tooling, and operational systems the marketing and sales teams now run on day to day.

7	1,488+	5	Daily

SELECTED WORK

GEO infrastructure — an AI-search visibility layer

AI infrastructure

AI crawlers were reading every site, completely untracked.

Designed and shipped five custom plugins (PrestaShop 1.7, PrestaShop 8, WordPress) tracking AI bot/crawler activity per page. Connected to the Claude API, the plugin auto-generates AI Page Summaries and FAQs on every product page, plus structured data and an llms.txt entry point — all deployed with no staging environment.

Built with PHP, PrestaShop hooks, WordPress REST API, JSON-LD, Claude API.

Securitaly HQ — the internal RevOps platform

Platform · flagship

No consolidated view of marketing or sales performance across seven brands.

Designed and built an internal analytics platform end to end — pipeline, database, dashboard — unifying GEO monitoring, SEO with YoY comparison, full-funnel newsletter analytics, conversion attribution, and an AI datasheet generator. Started as a Make.com/Sheets/Lovable prototype, rebuilt as a Python pipeline on GitHub Actions writing to Postgres once the no-code version hit its limits.

Built with Python, Supabase, GitHub Actions, Lovable, GA4/Search Console/Brevo/Claude APIs.

Newsletter & campaign attribution

Attribution

Email campaigns across seven brands, no link to revenue.

Built the join between Brevo (sends) and GA4 (behavior and purchases) using utm_id as the reliable key, producing a single per-campaign funnel — sent through purchase — in place of manual reporting across three tools. Processes 1,488+ historical campaigns.

Built with Brevo API, GA4 Data API, Python, Postgres upserts.

Conversion path & revenue visibility

Funnel tracking

B2B sales start with a contact form — nobody could see the path to it.

Added GA4 event tracking to reconstruct the path to conversion: which pages and traffic sources drive form fills and purchases, separated from AI-bot traffic. The same pipeline now surfaces brand-level sales with year-over-year comparison.

Built with GA4 event tracking, YoY reporting logic in Python.

AI datasheet generator for sales

Sales enablement

One datasheet meant a lot of back-and-forth between sales and marketing.

Built a three-step form — product identity, specs (typed, pasted, or PDF, any language), AI-drafted content — feeding the Claude API via a Supabase Edge Function. Template designed with marketing and design, so every output is on-brand and reviewed before reaching a customer.

Built with Claude API, Supabase Edge Functions. Half a day of work now takes seconds.

Shared AI prompt library

Enablement

Marketing and sales kept rebuilding the same prompts from scratch.

Set up a shared library on Google Drive — prompts organized by brand and department for recurring work like translations, product copy, and social captions.

Built with Google Drive, prompt engineering, documentation.

STACK & CAPABILITIES

Data & pipelines — Python, REST API integration, Supabase/Postgres schema design, GitHub Actions, upsert-based ETL

AI & automation — Claude API (server-side & edge functions), prompt engineering, GEO optimization, structured content generation

Platforms — PrestaShop (1.7.x & 8.x), WordPress, Lovable, GitHub, PHP, JavaScript, SQL

Some figures rounded to respect employer confidentiality.

Attribution & analytics — GA4 Data API, Search Console API, UTM-based joins, funnel and conversion tracking, YoY reporting

GTM systems & RevOps — Lead/funnel visibility design, email marketing ops (Brevo), stakeholder discovery, no-code-to-code migration

Operating context — Solo technical & AI function across 7 brands, production-only deployment discipline, multilingual (IT/EN/ES)
